---

### Setup

Use configured local/staging API, test database, Postman collection, and synthetic account. Never show secrets.

### Sequence

- Open root health route.
- Register and log in.
- Call protected profile.
- Create/list/get/update/delete workout.
- Search name/category/date.
- Call both AI endpoints.
- Show missing-token or invalid-input response.

### Collection expectations

Assertions expect register 200/201, login 200, workout create 201; these are expectations, not captured results.

### Fallback

If DB/Gemini is unavailable, show definitions and explain dependency; do not call examples live results.

### Evidence

No screenshots/video were included; capture real outputs during execution if needed.
